Juvenile Halibut in the Gulf of Alaska: Trawl Surveys, 1970-1972

INTRODUCTION

The International Pacific Halibut Commission annually estimates the relative abundance of young Pacific halibut (*Hippoglossus stenolepis*) at selected locations in the Gulf of Alaska (Figure 1). Originally, the surveys were restricted to shallow inshore waters, but an extensive trawl survey of the Gulf of Alaska indicated that young halibut were available offshore to depths of 100 meters and beyond (IPHC, 1964). Certain offshore grounds suitable for trawling and with a high abundance of halibut were included in the annual surveys beginning in 1963. A description of the methods and the results for the years 1967 through 1969 were published in previous reports (Best, 1969a, 1969b). The catch data from 1970, 1971, and 1972 are recorded in this paper but no attempt is made to analyze the significance of any changes in relative abundance of halibut from one year to the next.

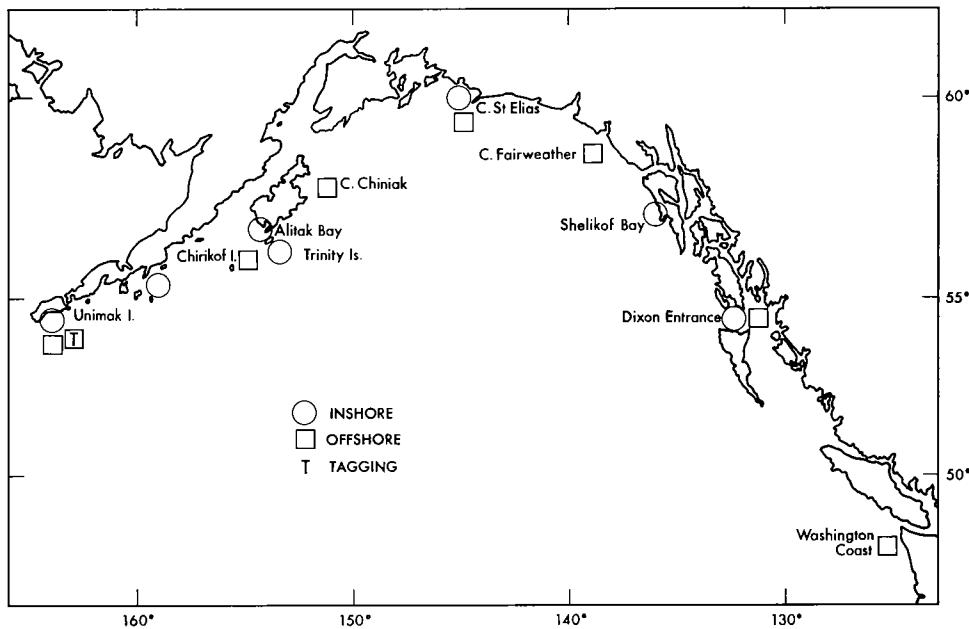

Figure 1. Sampling locations in the Gulf of Alaska.

Through the 1972 fishing season the minimum size for halibut was 26 inches or 5 pounds dressed head-off, which equates to 65 cm. Fish below that size were arbitrarily called juveniles and were the primary interest of the trawl surveys.

METHODS

Commercial trawlers are chartered for the surveys each year. The stations are sampled annually in mid-summer, but date of sampling varies slightly from year to year. The offshore stations are fished with a standard trawl having a 3.5-inch (90 mm) mesh codend, and the inshore stations are sampled with a small trawl with a 1.25-inch (32 mm) mesh codend. A standard haul is 60 minutes for a 3.5-inch mesh net and 15 minutes for a 1.25-inch mesh net. The catch at each station, regardless of time fished, is standardized to a 60-minute haul.

All halibut are sorted from the catch and placed in a live tank supplied with running seawater. The left otolith is collected from three halibut in each centimeter size group through 64 cm. The age of these fish is determined from the otolith and an age-length key is constructed for each area. All halibut are measured (total length) and those not selected for ageing are returned to the sea alive. Most hauls are also sampled for species composition.

New areas were added to the established sampling locations in 1971 to obtain more information on the distribution of juvenile halibut. The additional survey hauls were made with the 1.25-inch mesh net at inshore areas in the Shumagin Islands and Dixon Entrance and with the 3.5-inch mesh net at offshore areas off Cape Fairweather, Dixon Entrance, and the Washington coast in 1971. The offshore stations in Dixon Entrance were monitored again in 1972. Juvenile halibut have been tagged in conjunction with the trawl surveys to estimate the importance of the various nursery areas in providing recruitment to the commercial fishery. Additional offshore hauls were made after completion of the annual survey at Unimak Island in 1971 and 1972 to obtain fish to tag. A chronology of vessel operations during 1970, 1971, and 1972 is listed in Table 1. Two vessels were chartered for the survey in 1971, one operated exclusively in the Gulf of Alaska and the other was used at Unimak Island stations and in the Bering Sea. In 1970 and 1972 one vessel made both the Gulf of Alaska and Bering Sea surveys.*

CATCH DATA

Length composition of all halibut and the age composition through 64 cm in 1970, 1971, and 1972 are given in Tables 2, 3, and 4, respectively. Only 1% of the halibut at the inshore locations were larger than 64 cm. These larger fish have been included in the summary tables as a single size group, larger than 64 cm. The length composition of all halibut and the age composition through 64 cm from the offshore stations are given in Tables 5, 6, and 7 for the years 1970, 1971, and 1972, respectively.

The species composition of the catch from inshore and offshore stations for each year is summarized by area in Tables 8, 9, and 10. The 1.25-inch mesh net used at the inshore stations catches the smaller sizes of all species, consequently these catches should not be viewed as potential commercial concentrations. The catches from both inshore and offshore stations are listed by individual hauls in the Appendix.
